

Pyrrosia confluens

Pyrrosia confluens: Robber fern

Family: *Polypodiaceae*

Genus: *Pyrrosia* from the Greek *pyrros* (flame-coloured) in reference to the reddish-yellow colour of the fronds in some overseas species, due to the stellate hairs.

Species: *confluens* from the Latin *confluens* (running together, blending) in reference to the sori.

This epiphytic or lithophytic fern forms dense spreading colonies. Each leaflet is 3-25cm long and is thick, leathery and fleshy. It is mostly found on tree trunks and logs in rainforest and wet sclerophyll forest.

Spore pattern

On tree trunks

On rocks

Rhizome scales are appressed and fringed with hairs
